ART UNIT

PAPER NUMBER

2424

MAIL DATE

DELIVERY MODE

08/27/2009

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 09/903,014	Applicant(s) OHATA ET AL.	
	Examiner JOSEPH G. USTARIS	Art Unit 2424	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 06/02/2009.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,2,7-9,12-14,23,24,28-31,34-36,45-47 and 49 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,2,7-9,12-14,23,24,28-31,34-36,45-47 and 49 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 1, 2, 7-9, 12-14, 23, 24, 28-31, 34-36, 45-47, and 49 have been considered but are moot in view of the new ground(s) of rejection.

Claim Objections

2. Claims 1, 2, 7-9, 12-14, 23, 24, 28-31, 34-36, 45-47, and 49 are objected to under 37 CFR 1.75.

Claims 1, 2, 7-9, 12-14, 23, 24, 28-31, 34-36, 45-47, and 49 recites the limitation "the plurality imaging apparatuses." There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claim(s) 1-2, 7, 9, 12-13, 23-24, 28-29, 31, 34-35, 45-47, and 49 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Riggins, III (US 6,195,090; cited in prior Office Action) in view of Limor et al. (US 2002/0090217; cited in prior Office Action) and Frederick (US007106360B1).

As to claims 1, 2, 9, 12, 23, 24, 28, 31, 34, 45-47 and 49, Riggins does not expressly teach GPS position information received from an imaging apparatus that is operable to acquire imaging area information concerning the corresponding program and is disposed mechanically independent of a movable body that is an object in the corresponding program, and displays an image of an imaging apparatus mounted on the specific object when the specific object is not a subject of the plurality imaging apparatuses.

In analogous art, Limor et al. ("Limor") teaches GPS position information received from an imaging apparatus (Figs. 1 and 2—camera station 18) that is operable to acquire imaging area information concerning the corresponding program and is disposed mechanically independent of a movable body (Figs. 1 and 3—car 12) that is an object in the corresponding program (Figs. 1-4; paragraphs 22-26, 29, 31, 39 and 40—camera station, or "imaging apparatus", 18 acquires imaging area information of the race car track and is mechanically independent of car, or "movable body", 12).

Therefore, it would have been obvious to one of ordinary skill in the art to modify Riggins to teach wherein the data collection station (col. 2, lines 65-67), or "imaging apparatus", to have GPS position information received from the imaging apparatus that is operable to acquire imaging area information concerning the corresponding program and is disposed mechanically independent of a movable body that is an object in the corresponding program, as taught by Limor, in order to point a camera unit at the car as the car moves along the track (Limor: paragraph 40).

Frederick discloses a sports distribution system. Frederick discloses displaying an image of an imaging apparatus mounted on the specific object (See Fig. 1; col. 4 lines 19-27). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system disclosed by Riggins in view of Limor to mainly display an image of an imaging apparatus mounted on the specific object, as taught by Frederick, in order to allow the viewer to have a greater experience (See col. 5 lines 27-35). Furthermore, Limor discloses a condition when the cameras cannot find a car (See Fig. 5, 212 and 214). Therefore, based on the teaching of Frederick and Limor, there exists a condition where the system displays an image of an imaging apparatus mounted on the specific object (See Frederick Fig. 1; col. 4 lines 19-27) when the specific object is not a subject of the plurality imaging apparatuses (See Limor Fig. 5, 212 and 214; cameras cannot find cars on track).

As to claim 1, Riggins teaches a digital broadcast signal processing apparatus comprising:

a memory section for storing GPS position information received from a movable body that is an object in a corresponding program (Fig. 4, col. 7, lines 25-42); and

a multiplex processing section for multiplexing on a digital broadcast signal of the corresponding program 1) GPS position information received from the movable body, 2) GPS position information and imaging area information received from an imaging apparatus (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45) and (Limor Figs.

Art Unit: 2424

1-4; paragraphs 22-26, 29, 31, 39 and 40), and 3) mapping information (e.g. telemetry data and GPS data) indicating position information of the moveable body and position information of the imaging apparatus on a map (e.g. near video quality three-dimensional model of the racetrack and competing vehicles) (See Riggins col. 12 lines 7-26 and Limor Fig. 1; paragraphs 0029 and 0040),

a display (e.g. TV set 27 or computer display 33) for mapping positions of a plurality of moveable bodies on the map and displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to

Art Unit: 2424

simulate the race).

As to claim 2, Riggins teaches a digital broadcast signal processing apparatus comprising:

a mapping processing section for mapping on a map position information of a movable body that is an object in a corresponding program and position information of an imaging apparatus on a basis of information of a map (See Limor Fig. 1; paragraphs 0029 and 0040; e.g. the GPS signal gives coordinates on a map), GPS position information received from the movable body and GPS position information received from the imaging apparatus (Figs. 3 and 4; col. 7, lines 25-42; col. 9, line 47-col. 10, line 11); and

a multiplex processing section for multiplexing mapping information generated by said mapping processing section on a digital broadcast signal (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for mapping positions of a plurality of movable bodies on the map and displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race.

Art Unit: 2424

This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 7, Riggins teaches said multiplex processing section multiplexes profile information concerning the movable body on the digital broadcast signal (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45).

As to claims 9 and 31, Riggins teaches a digital broadcast signal processing apparatus comprising:

a mapping processing section for separating from a digital broadcast signal that was received or reproduced GPS position information of a movable body that is an object in a corresponding program and GPS position information of an imaging apparatus, to map position information of the movable body and the imaging apparatus

Art Unit: 2424

on a map on a basis of information of a map (See Limor Fig. 1; paragraphs 0029 and 0040; e.g. the GPS signal gives coordinates on a map), GPS position information of the movable body and GPS position information of the imaging apparatus (Figs. 3 and 4; col. 7, lines 25-42; col. 9, line 47-col. 10, line 11; and

a multiplex processing section for multiplexing mapping information generated in said mapping processing section on a digital broadcast signal of the corresponding program (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for mapping positions of a plurality of movable bodies on the map and displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45;

Art Unit: 2424

e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 12, Riggins teaches a digital broadcast signal processing apparatus comprising:

a memory section for storing profile information concerning a movable body that is an object in a corresponding program (Fig. 4; col. 7, lines 25-42); and

a multiplex processing section for multiplexing on a digital broadcast signal the profile information, position information of an imaging apparatus that was received or reproduced (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45), and mapping information (e.g. GPS data) indicating position information of the imaging apparatus on a map (Limor Fig. 1; paragraphs 0029 and 0040); and

a display (e.g. TV set 27 or computer display 33) for mapping positions of a plurality of movable bodies on the map and displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race.

Art Unit: 2424

This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 13, Riggins teaches wherein position information of the movable body that is the object, mapping information generated by mapping of the position information of the movable body that is the object and/or position information of an imaging apparatus on a map, imaging area information by the imaging apparatus and object information by the imaging apparatus is multiplexed on the digital broadcast signal (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45).

As to claim 23, Riggins teaches a digital broadcast signal processing method comprising the steps of:

reading out GPS position information received from a movable body that is an object in a corresponding program (Fig. 4—41; col. 7, lines 25-42);

reading out GPS position information received from an imaging apparatus; and multiplexing GPS position information received from the movable body, GPS position information received from the imaging apparatus, and mapping information (e.g. telemetry data and GPS data) indicating position information of the moveable body and the imaging apparatus on a map (e.g. near video quality three-dimensional model of the racetrack and competing vehicles) (See Riggins col. 12 lines 7-26 and Limor Fig. 1; paragraphs 0029 and 0040) on a digital broadcast signal of the corresponding program (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

mapping positions of a plurality of movable objects on the map (See Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the

Art Unit: 2424

multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 24, Riggins teaches a digital broadcast signal processing method comprising the steps of:

mapping on a map position information of a movable body that is an object in a corresponding program and position information of an imaging apparatus on a map on a basis of information of a map (See Limor Fig. 1; paragraphs 0029 and 0040; e.g. the GPS signal gives coordinates on a map), GPS position information received from the movable body and GPS position information received from the imaging apparatus, (Figs. 3 and 4; col. 7, lines 25-42; col. 9, line 47-col. 10, line 11); and

multiplexing mapping information generated in said mapping step on a digital broadcast signal (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 28, Riggins teaches a digital broadcast signal processing method comprising the steps of:

reading out GPS position information received from a movable body that is an object in a corresponding program (Fig. 4—41; col. 7, lines 25-42);

reading out imaging area information by an imaging apparatus (Fig. 4—41; col. 7, lines 25-42);

reading out GPS position information received from an imaging apparatus; and multiplexing GPS position information received from the movable body, GPS position information received from the imaging apparatus, the imaging area information, and mapping information (e.g. telemetry data and GPS data) indicating position information of the moveable body and the imaging apparatus on a map (e.g. near video quality three-dimensional model of the racetrack and competing vehicles) (See Riggins col. 12 lines 7-26 and Limor Fig. 1; paragraphs 0029 and 0040) on a digital broadcast signal of a the corresponding program (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

mapping positions of a plurality of movable objects on the map (See Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the

Art Unit: 2424

multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 29, Riggins teaches multiplexing profile information concerning the movable body on the digital broadcast signal (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45).

As to claim 34, Riggins teaches a digital broadcast signal processing method comprising the steps of:

reading out profile information concerning a movable body that is an object in a corresponding program (Fig. 4—41; col. 7, lines 25-42);

reading out GPS position information of an imaging apparatus; and multiplexing the profile information concerning the movable body, the GPS position information of

Art Unit: 2424

the movable body (e.g. telemetry data), and mapping information indicating position information of the movable body on a map (e.g. near video quality three-dimensional model of the racetrack and competing vehicles) (See Riggins col. 12 lines 7-26) on a digital broadcast signal (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and mapping positions of a plurality of movable objects on the map (See Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45;

Art Unit: 2424

e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 35, Riggins teaches wherein position information of the movable body that is the object, mapping information generated by mapping of the position information of the movable body that is the object and/or position information of an imaging apparatus on a map, imaging area information by the imaging apparatus and object information by the imaging apparatus is multiplexed on the digital broadcast signal (Figs. 2-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45).

As to claim 45, Riggins teaches a digital broadcast signal processing method comprising the processes of:

multiplexing on a picture signal GPS position information received from a movable body that is an object in a corresponding program and GPS position information received from an imaging apparatus (Fig. 4—74; col. 7, lines 25-42), and mapping information (e.g. telemetry data and GPS data) indicating position information of the moveable body and the imaging apparatus on a map (e.g. near video quality three-dimensional model of the racetrack and competing vehicles) (See Riggins col. 12 lines 7-26 and Limor Fig. 1; paragraphs 0029 and 0040); and

transmitting the picture signal after the multiplexing process as a digital broadcast signal (Fig. 4—77; col. 7, lines 25-42); and

mapping positions of a plurality of movable objects on the map (See Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 46, Riggins teaches s digital broadcast signal processing method comprising the processes of:

 multiplexing on a picture signal GPS position information of a movable body that is an object in a corresponding program, GPS position information of an imaging apparatus, and mapping information (e.g. telemetry data and GPS data) indicating position information of the moveable body and the imaging apparatus on a map (e.g. near video quality three-dimensional model of the racetrack and competing vehicles) (See Riggins col. 12 lines 7-26 and Limor Fig. 1; paragraphs 0029 and 0040) (Fig. 4—74; col. 7, lines 25-42); and

 transmitting the picture signal after the multiplexing process as a digital broadcast signal (Fig. 4—77; col. 7, lines 25-42); and

 mapping positions of a plurality of movable objects on the map (See Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

 a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the

Art Unit: 2424

multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 47, Riggins teaches a digital broadcast signal processing method comprising the processes of:

multiplexing on a picture signal mapping information generated by mapping on a position information of a movable body that is an object in a corresponding program and position information of an imaging apparatus (Figs. 3 and 4—74; col. 7, lines 25-42) on a basis of information of a map (See Limor Fig. 1; paragraphs 0029 and 0040; e.g. the GPS signal gives coordinates on a map), GPS position information received from the movable body (e.g. telemetry data) and GPS position information received from the imaging apparatus (See Limor Fig. 1; paragraphs 0029 and 0040); and

transmitting the picture signal after the multiplexing process as a digital broadcast signal (Fig. 4—77; col. 7, lines 25-42); and

mapping positions of a plurality of movable objects on the map (See Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

As to claim 49, Riggins teaches a digital broadcast signal processing method comprising the processes of:

multiplexing on a picture signal profile information concerning a movable body that is an object in a corresponding program and GPS position information of an imaging apparatus (Fig. 4—74; col. 7, lines 25-42) and mapping information (e.g. telemetry data and GPS data) indicating position information of the moveable body and the imaging apparatus on a map (e.g. near video quality three-dimensional model of the racetrack and competing vehicles) (See Riggins col. 12 lines 7-26 and Limor Fig. 1; paragraphs 0029 and 0040); and

transmitting the picture signal after the multiplexing process as a digital broadcast signal (Fig. 4—77; col. 7, lines 25-42); and

mapping positions of a plurality of movable objects on the map (See Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45); and

a display (e.g. TV set 27 or computer display 33) for displaying a positional relationship between the movable bodies on the screen as a function of the multiplexing processing section (Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race. This is a function of the multiplexing processing section because the

Art Unit: 2424

multiplexing processing section provides the all the data needed to construct the simulation),

wherein, when a specific object chasing function is selected (See Limor paragraphs 0029; when cameras are assigned to cars), the display maps the positions of the specific object and plurality of movable bodies on the map (See Limor Fig. 1; paragraph 0027 and Riggins Figs. 1-5; col. 11, line 65-col. 12, line 31; col. 9, line 47-col. 10, line 11; col. 2, line 30-col. 3, line 18; col. 5, lines 25-38; col. 6, line 1-col. 7, line 45; e.g. the system displays a three-dimensional model of the actual racetrack, all of the competing vehicles, and camera positions to achieve different angles in order to simulate the race).

5. Claims 8, 14, 30, and 36 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Riggins III (previously cited) in view of Limor (previously cited) and Frederick (previously cited), as applied to claims 7, 12, 29 and 34, and further in view of Yuen et al. (US 2005/0198668; cited in prior Office Action).

As to claims 8, 14, 30, and 36, Riggins III does not specifically teach said profile information includes uniform resource locator (URL) information or mail address information, both being for access to information concerning the movable body.

In analogous art, Yuen et al. ("Yuen") teaches said profile information includes uniform resource locator (URL) information or mail address information, both being for access to information concerning the movable body (paragraph 51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Riggins III, Limor, and Frederick by having the profile information include uniform resource locator (URL) information or mail address information, both being for access to information concerning the movable body, as taught by Yuen, so as to provide additional information about the data provided on the display (Yuen: paragraph 51).

Conclusion

6. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
